Features	
Features	Ease of Use and Deployment Superior Redundancy for Fault Backup Integrated CISCO IOS Software Features for Bandwidth Management Advanced QoS Granular Rate Limiting Port-based ACLs for Layer 2 interfaces allow application-specific filtering Unicast MAC filtering prevents the forwarding of any type of traffic to a port that has not already learned how to forward. SSHv2 and SNMPv3 provide network security by encrypting management sessions. SSHv2 and the cryptographic version of SNMP are not supported because of U.S. export restrictions. Bidirectional data support on the Switched Port Analyzer (SPAN) ports allows the use of the Switched Port Analyzer (SPAN) detection system (IDS) to take action when an intruder is detected. TACACS+ and RADIUS authentication enable centralized management of users from altering the configuration. MAC address notification allows administrators to be notified of unknown MAC addresses on the network. DHCP snooping allows administrators to ensure consistency in the DHCP process and is used to prevent attacks that attempt to poison the DHCP process by flooding the amount of DHCP traffic that enters a switch port. DHCP Interface Tracker (Option 82) feature augments a Port security feature to secure the access to an access or trunk port. After a specific timeframe, the aging feature removes the MAC address from the device to connect to the same port.
